There's a few things to understand in order to answer the question. The first is what a hash is. The short version is that if the input is "Hi" or "Hello" or "This is an even longer output, and that output will always be the same size. Another aspect of a hash function is that it is "one way" output, but it's basically impossible to get some hash considered broken and unusable if you are able to do churn through inputs and outputs and record them in tables. That's why websites often add "salt" to some arbitrary random data to add in, so that rainbow table in a rainbow table, but if the site adds random letter
